@MetExplore

A use case of MetExplore

It is better to use Chrome web browser.

MetExplore (Cottret et al., 2010) is a web server dedicated to the analysis of genome scale metabolic networks. A special care was taken to allow analyzing metabolomics data in the context of this network.

► Go on the MetExplore homepage and click on the "Click here" button

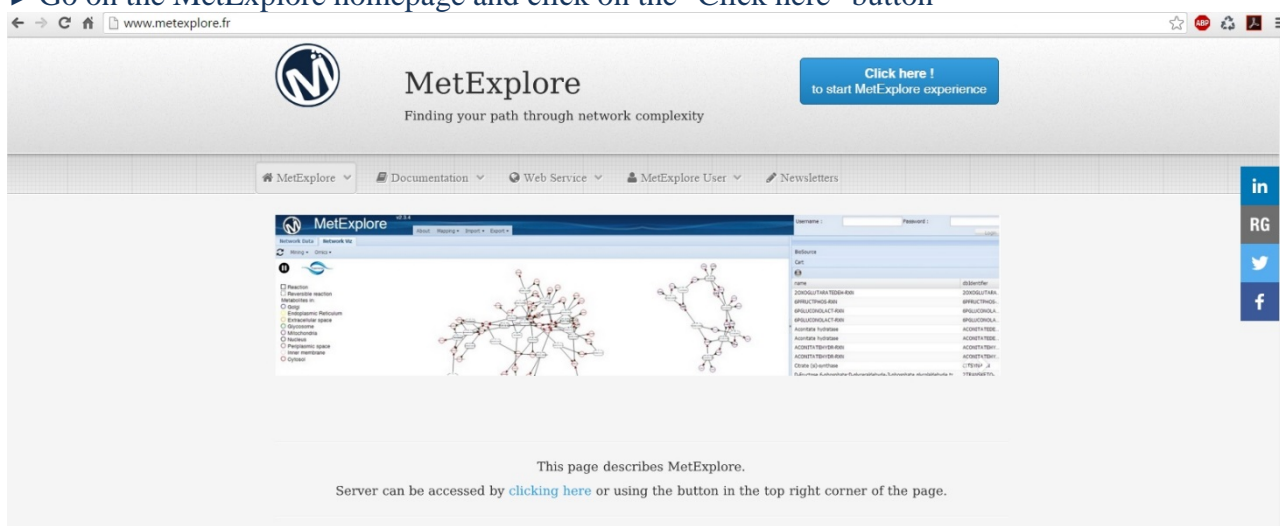

Figure 1: MetExplore homepage

MetExplore is providing access to BioCyc networks, KEGG networks and networks imported from SBML files (Hucka et al., 2003). All these files are present in the "public BioSource" repository. Note that you can also register and upload your own SBML files. You will then be the only one to be able to access these networks and will have the opportunity to share them with others.

► In the list of biosources click on: "Saccharomyces cerevisiae"

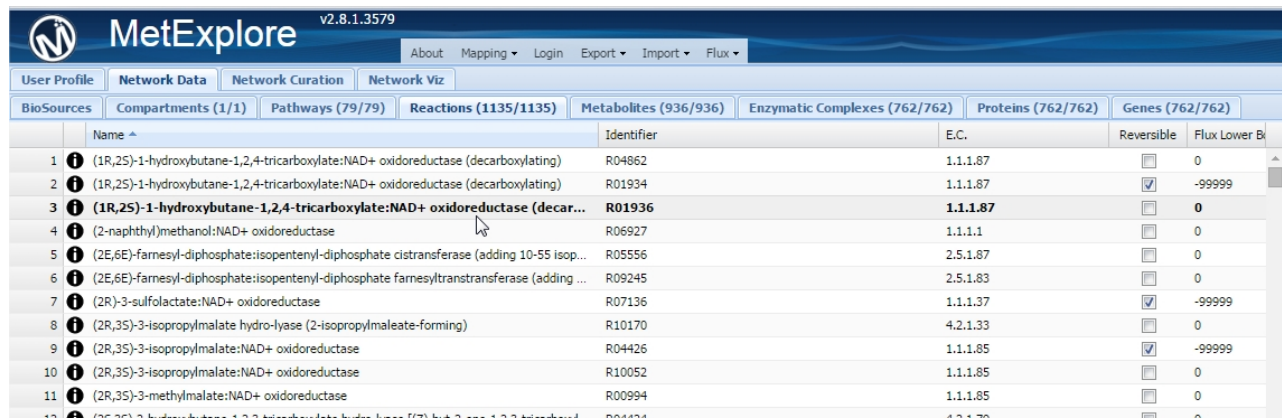

► Right click on the line of KEGG version of the network then click on "select Biosource" (you can also double click on it)

Rickettsia rickettsii							
Rickettsia typhi

Selaginella moellendorffii							
Setaria italica							
Shigella boydii							

Figure 2: BioSource selection interface in MetExplore

The content of the metabolic network will be displayed in a tabular format.

Information on Compartments, Pathways, Reactions, Metabolites, Enzymes, Proteins and Genes are available.

	Name	Identifier	E.C.	Reversible	Flux Lower Bound
1	(1R,2S)-1-hydroxybutane-1,2,4-tricarboxylate:NAD+ oxidoreductase (decarboxylating)	R04862	1.1.1.87	<input type="checkbox"/>	0
2	(1R,2S)-1-hydroxybutane-1,2,4-tricarboxylate:NAD+ oxidoreductase (decarboxylating)	R01934	1.1.1.87	<input checked="" type="checkbox"/>	-99999
3	(1R,2S)-1-hydroxybutane-1,2,4-tricarboxylate:NAD+ oxidoreductase (decar...	R01936	1.1.1.87	<input type="checkbox"/>	0

Figure 3: MetExplore representation of metabolic network content.

We are going to perform this mapping on yeast and using the metabolite identifiers found in the KEGG database

► Select "Mapping" in the menu at the top of the page.

► Copy (ctrl+C on the excel table) and paste (click on the first line of the MetExplore table and Ctrl+V)

MetExplore v2.11.2 interface showing the 'Mapping' tab. The 'Copy/Paste in grid' section displays a table of metabolites:

Object	Metabolite	Element	Identifier	condition
1	C00062			1.9
2	C00051			33.9
3	C00073			0.3
4	C00188			0.6
5	C00263			0.6
6	C00669			192.2
7	C00170			11
8	C00065			0.2
9	C02291			50.5
10	C00082			2.9

The 'Selected BioSource' section shows 'Saccharomyces cerevisiae' selected. The 'Map' button is highlighted. To the right, a Microsoft Excel window shows the same table of metabolites.

Figure 4: import metabolites in MetExplore

► Click on the "Map" button

Coming back to the tabular view, you will see which metabolites were mapped. (in the metabolite panel)

Figure 7: Network visualisation in MetExplore

► Click on the "Omics" menu and then on "Import mapping"
Metabolites mapped are now colored in blue.

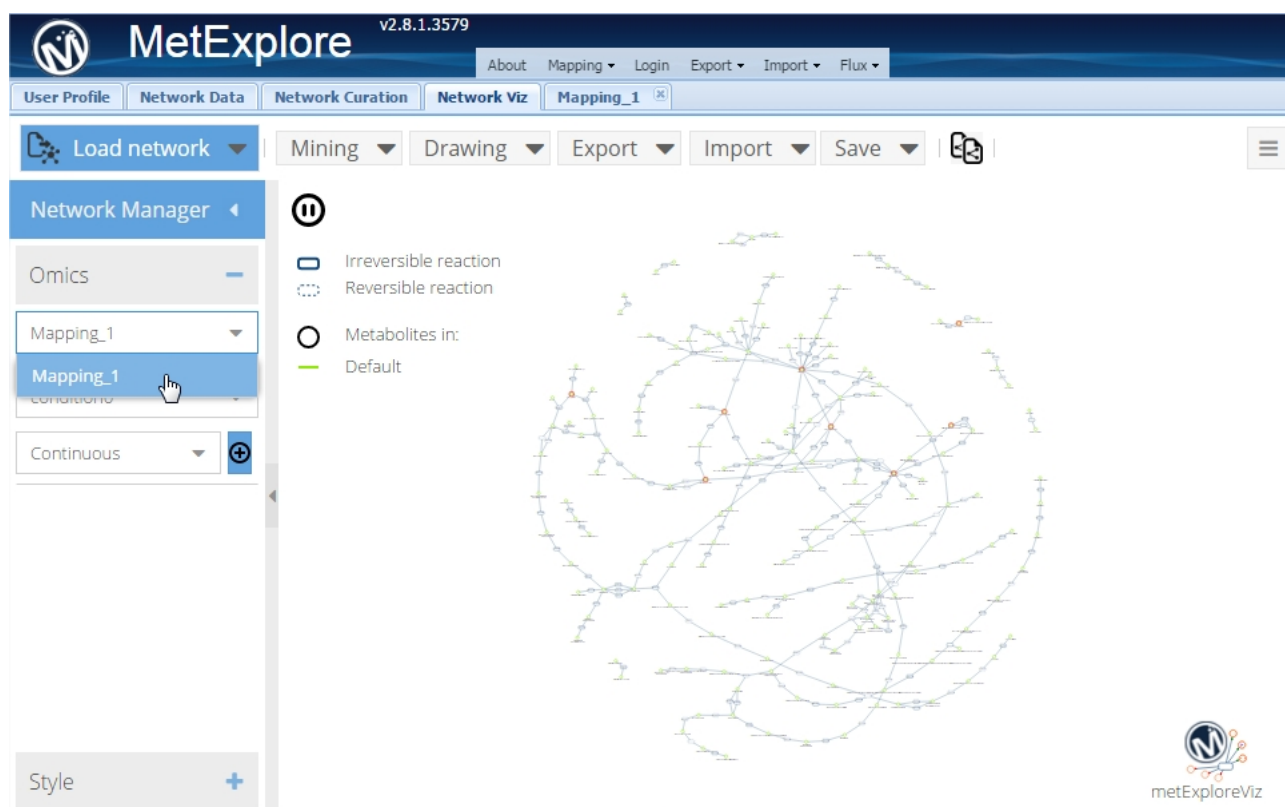

Figure 8: Network based on enriched pathways in MetExplore

► On the left of the panel in the "Omics" box select "Mapping_1". It will highlight in red metabolites mapped.

► Click on "Mining->Highlight subnetwork" to emphasize the union of all lightest paths between each pair on identified metabolites

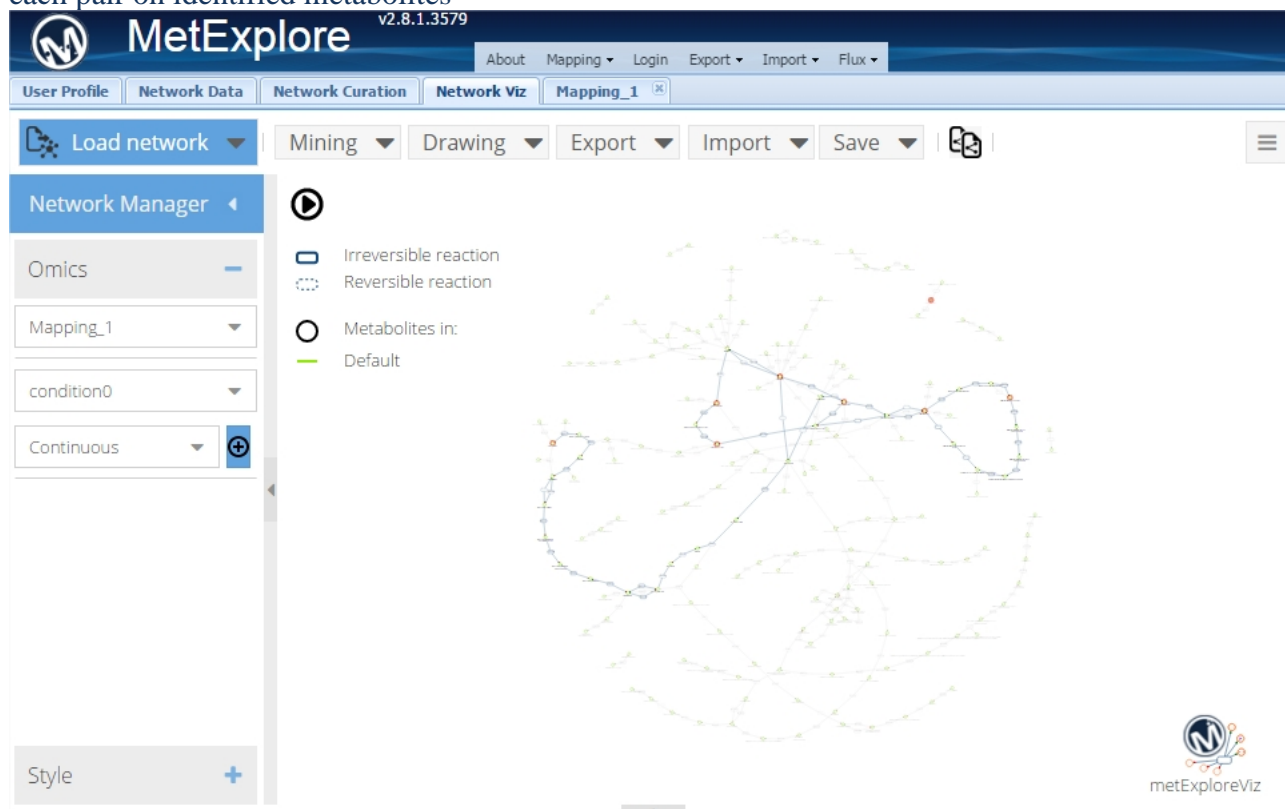

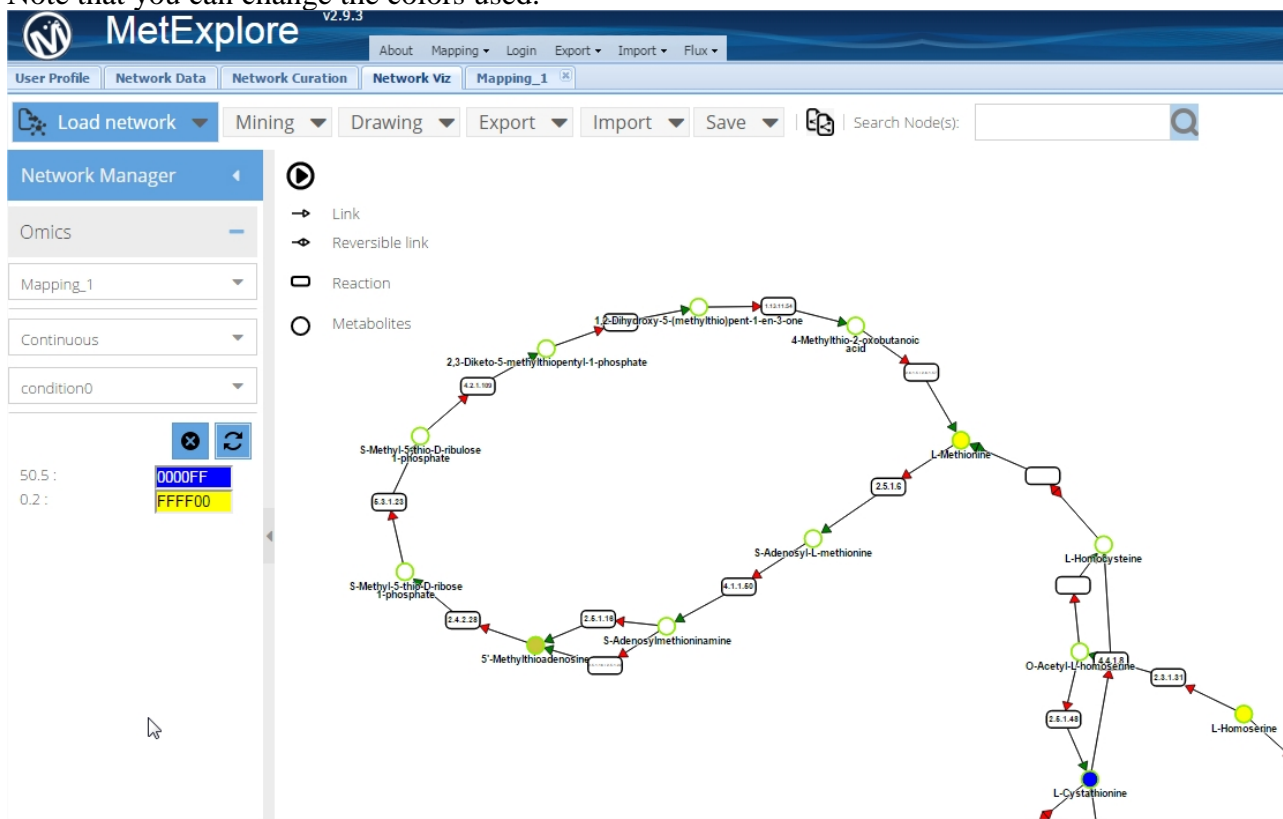

Figure 9: sub-network connecting identified metabolites

► Click on "Mining->Extract subnetwork" to keep only the subnetwork.

► Click on the "+" button to perform a continuous mapping of data on nodes.

Note that you can change the colors used.

This computation is performed on a selection of reactions. It is also possible to do it on the entire network. It will allow connecting other metabolites.

In MetExplore, mapping can be saved in the database (function accessible through web services). Then it is possible to access the mapping through a single URL (here it is the mapping of Metabolights dataset MTBLS174 on Recon2 human metabolic network):
